

# Perioperative Blood Management Anaesthetist Survey

This survey is part of a wider national project focusing on the organisational structure and variation of practice regarding perioperative blood management of adults. We want to work towards getting a clear picture on what is happening across the UK. We hope this will not only answer some important questions but also identify some key areas for quality improvement.

The individual anaesthetist survey looks at anaesthetists' experiences of patient care and typical practice during 3 common clinical scenarios. The scenarios are major orthopaedics, major colorectal cancer surgery and obstetrics. It should take no longer than 10-15 minutes to complete and you only need to complete scenarios that make up your regular clinical practice.
